R23EJ138

Program and Section

CSIT 'C'

Project title

Curriculum Design Framework

Faculty guide

Prof. Kavya A K

Internship Report — Phase 1

Technical practice, workplace methods and placement readiness

Report basis

Project descriptions are based on repository documentation. The host organization, review dates, attendance, mentor feedback, personal ratings, interview results and individual work history were not present in source files. Those personal facts are identified, not invented.

1. Organization, team and module overview

1.1 Organization and team

The work represented in the repository is an academic software project for curriculum design and verification. The team scope spans a Next.js interface, FastAPI services, relational data, document ingestion and graph-assisted analysis. The supplied template names REVA University, but repository evidence does not verify a separate internship host, team structure or reporting mentor. Add the confirmed organization profile and reporting relationship.

1.2 Assigned module and problem statement

The project module is the Curriculum Design Framework. It addresses the difficulty faculty and curriculum committees face when reviewing outcome coverage, prerequisite order, course overlap and structural consistency across a degree program. Structured data and uploaded syllabus documents are processed through API and service layers; deterministic and graph checks create evidence-backed advisory findings for human review. LLM assistance is limited to extraction/drafting and is not the authority for verification.

1.3 Technology stack

Layer	Technology	Purpose	Start → current
Frontend	Next.js App Router, React, TypeScript, Tailwind	Curriculum workspace, dashboards and visualization.	Self-rate
Backend	Python, FastAPI, Pydantic, Uvicorn	REST endpoints, validation and business services.	Self-rate
Persistence	PostgreSQL, SQLAlchemy, Alembic	Authoritative data and schema migrations.	Self-rate
Graph	Neo4j, Cypher	Optional version-scoped relationship projection.	Self-rate
Document/AI	PDF/DOCX/text extraction, LLM client, UploadThing adapter	Upload, extraction and structured draft assistance.	Self-rate
Engineering	Git/GitHub, uv, pytest, Ruff; README also lists Docker/Postman/VS Code	Versioning, environment, testing, lint and development.	Confirm use

2. Technical fundamentals and placement-aligned proficiency

The rubric requests Week 1 baseline and current self-ratings. These are private self-assessments and were not supplied, so numerical ratings are left open. The improvement column is populated with the project concepts to study/demonstrate; replace it with what you actually did.

Area	Baseline /5	Now /5	Project-aligned improvement evidence
Data structures & algorithms	Personal	Personal	Explain prerequisite graph traversal, cycles and path analysis; verify complexity in code.
Operating systems	Personal	Personal	Understand app/worker lifecycle, process configuration, environment and retries.
DBMS	Personal	Personal	Practice relational schemas, keys, migrations, transactions and version-scoped queries.
Computer networks	Personal	Personal	Explain HTTP/REST, JWT bearer auth, uploads and service connectivity.
Assigned technology	Personal	Personal	Trace frontend request through API, service/repository, PostgreSQL and optional Neo4j.

3. Workplace practices, documentation and industry tools

3.1 Coding and documentation standards

Project guidance enforces separation of routers, services, repositories, schemas and database models. API requests/responses use DTO schemas rather than exposing persistence models; database changes use Alembic. Requirements and LLDs live under `docs/`, and backend tests are organized by feature/API. Examples in the repository include LLDs for authentication, curriculum management, graph projection, document processing and verification, plus feature-specific pytest modules. Branch, code-review and commit-message conventions must be confirmed with the mentor; personal examples should come from your commits.

3.2 Tools used

Tool	Used for	Evidence / note
Git / GitHub	Version control, review and collaboration.	Add own commits/PRs.
Python + uv	Backend environment and commands.	Setup documented in README.
pytest / Ruff	Backend tests and style checks.	Run and record real results.
Next.js / npm	Frontend development, lint and build.	Validate current branch scripts.
PostgreSQL / Alembic	Database and migrations.	Migrations in backend/alembic.
Neo4j / Docker	Optional graph projection/local service.	README explains optional setup.
Postman / VS Code	API testing/editor.	README lists; confirm personal use.

4. Guide feedback and professional conduct

4.1 Requirement review

A dated mentor review record was not supplied. The confirmed project requirements include authenticated curriculum management, outcome mapping, prerequisite verification, document ingestion and advisory reports. Design clarifications in project documentation include keeping verification deterministic/read-only, requiring human review, making Neo4j optional and governing reference rules. Insert the actual review date, participants and which decisions your mentor personally validated.

4.2 Guide feedback and response

Feedback point	Action taken	Status
Personal mentor feedback not supplied.	Record exact feedback and link the resulting change/evidence.	Requires student input
Personal mentor feedback not supplied.	Record exact feedback and link the resulting change/evidence.	Requires student input
Personal mentor feedback not supplied.	Record exact feedback and link the resulting change/evidence.	Requires student input

4.3 Professional conduct

Professional conduct is not evidenced in the code repository, and no attendance sheet, meeting record or mentor evaluation was supplied. The factual assessment of attendance, punctuality, communication, teamwork, deadline management and disagreements is therefore left for the student/mentor. Suggested evidence to attach: dated meeting minutes, attendance record, reviewed work items and written feedback. No conduct claim is fabricated.

5. Reflection, placement readiness and capstone showcase

5.1 Mock interviews

Round	Date	Topics	Score / feedback	Improvement
Mock interview 1 (Week 7)	Not supplied	Not supplied	Not supplied	Requires actual evaluator notes
Capstone mock (Week 15)	Not supplied	Project architecture is a suggested topic, not a verified interview record.	Not supplied	Requires actual evaluator notes

No mock-interview records or scores were available. The table is retained so the actual round/date/evaluator feedback can be entered; planned topics must not be represented as completed interviews.

5.2 Resume, LinkedIn and portfolio

Resume, LinkedIn and portfolio URLs were not supplied and are intentionally omitted. Add the actual links and summarize verified changes made after mentor/faculty comments. Use only public, non-sensitive project material.

5.3 Reflection (project-based draft; personalize)

Working with the Curriculum Design Framework has provided a concrete setting for connecting software engineering ideas to academic quality assurance. The project illustrates why curriculum data needs both structured records and relationship-aware analysis: outcomes, course mappings, semester placement and prerequisites are linked rather than isolated fields. Its documented architecture has helped me understand how a frontend request flows through a REST API, service logic and repositories to PostgreSQL, while an optional Neo4j projection supports graph exploration. I have also learned that automation must be accountable. Verification findings are designed to include evidence and remain subject to human review; LLM assistance supports extraction and drafting rather than making academic decisions. Versioning, migrations and tests are important because curriculum changes must be traceable and repeatable. For placement preparation, I should be able to explain the data model, API security, graph reasoning and testing strategy, and support those explanations with code or test evidence. The next step is to validate my own learning against the Week 1 self-assessment and mentor feedback, then add a real challenge I faced and how I resolved it. My placement readiness is a personal assessment and should be stated honestly after mock interview feedback.

This reflection is a project-based draft, not a claim about specific personal events. Personal challenge, baseline skills and readiness require your experience.

5.4 Capstone showcase plan

Point	Demo / evidence
1. Curriculum management	Show a sanitized curriculum/version with semesters, courses and outcomes.
2. Verification	Demonstrate one evidence-backed prerequisite/outcome/structure finding and human-review status.
3. Architecture	Trace UI → authenticated API → service/repository → PostgreSQL; explain optional graph projection and tests.

Evidence and submission checklist

Attach available authentic records: mentor-signed requirements review and revised notes, feedback form/action plan, reflective write-up, mock interview evaluation, resume/portfolio proof and showcase media. The repository did not contain these personal artifacts. Also confirm the real organization/mentor, internship dates, attendance, Week 1 ratings and individual contribution.

Declaration

I declare that this report is my own work and that submitted evidence is genuine. Project details are based on repository documentation; personal records and declarations must be verified by the student.
